BACKTRACK: Your GPS for Learning  
University of the Philippines Manila  
203 words · Maximum 300 words

BACKTRACK creates value by helping learners choose useful review and helping schools organize repeated Khan practice around current needs. Core learner access will remain free. Funding decisions will follow measured costs and conversations with institutional budget owners.

A PHP 100,000 implementation scenario allocates PHP 24,000 to learning design and mathematics review; PHP 18,000 to access support; PHP 16,000 to school deployment; PHP 18,000 to evaluation; PHP 8,000 to product operations; PHP 8,000 to teacher onboarding and replication; PHP 3,000 to recruitment content; and PHP 5,000 to contingency. The team will confirm quotes and approved grant expenses before committing funds. The separate team award is excluded.

We will record actual cash expenditure, in-kind hours, support time per school, and the cost of adding a reviewed destination. Unit economics will distinguish cost per enrollee, active learner, and documented retained reentry. Registrations will not substitute for learning outcomes in the denominator.

Continuation options include university extension, school networks, education nonprofits, LGUs, and CSR sponsors supporting access and implementation. We will interview actual budget owners about their decision process and evidence requirements before proposing a price. By March, continuation requires an institutional owner, a maintainable destination kit, feasible access, and evidence that the routine justifies its cost.
