

Meaningful Khan Academy Integration

BACKTRACK: Your GPS for Learning

University of the Philippines Manila

255 words · Maximum 300 words

BACKTRACK gives learners a specific reason to use Khan Academy: an earlier step that stands between them and today's lesson. Each destination maps prerequisites to Khan explanations and exercises. Inside BACKTRACK, a concise concept, worked example, and local practice connect that material to the learner's need. Official videos can start and stop at a relevant segment, with an option to continue watching. Original Khan exercises remain available for extended practice.

In the proposed school pilot, teachers confirm the current destination and assign the mapped exercises in their existing Khan classes. Learners investigate their route, complete relevant practice, and return for fresh checks. The routine repeats across teaching weeks rather than ending at registration or a single lesson open.

We will distinguish three evidence sources: BACKTRACK activity, authorized Khan assignment or teacher-report evidence, and separate supervised destination assessments. A video open, a learner's practice report, and a correct return task are different events. None will be silently counted as another.

Khan's published teacher reporting tools provide a practical starting point, including assignment-score CSV exports. We will confirm available fields and authorized access with each partner and during capacity building. The workflow can use existing teacher-authorized reports while the team explores further supported integrations.

Meaningful-use measures will include repeated completion of relevant Khan assignments across offered weeks, supported by available reports, alongside learning outcomes and teacher effort. Khan provides the explanations, exercises, and classroom reporting. BACKTRACK tests whether a clear reason for practice and a checked return can make those resources more useful and more consistently used.
