BACKTRACK: Your GPS for Learning

University of the Philippines Manila

217 words · Maximum 300 words

By March 31, 2027, we want evidence of a specific change: learners who initially could not complete a current mathematics goal can complete a fresh version after targeted practice, and can still do so later.

Our signature outcome is retained reentry. The numerator is eligible baseline-blocked learners who meet a prespecified criterion on both immediate and 7-14-day delayed destination assessments. The denominator is all enrolled eligible baseline-blocked learners. Missing follow-up will be reported explicitly and will not disappear from the primary summary.

Teachers will review parallel forms and supervise formal checks. The public product's two-answer rule is useful practice evidence, not a substitute for that evaluation. Where practical and approved, a randomized delayed-start comparison will contrast the BACKTRACK-supported workflow with equal-time teacher-selected Khan practice. If a credible comparison cannot be executed, we will report feasibility and associations rather than causal gains.

Secondary measures include active time to reentry, repeated relevant Khan use, learner frustration and voluntary continuation, teacher minutes, and actual cost per documented outcome. Time analyses will include learners who have not reentered, rather than reporting only fast finishers.

The proposed 80-120 learner target depends on school access and permissions. A successful implementation should leave both credible evidence and a kit another educator can reproduce, including an honest account of who the model did not reach.
