BACKTRACK: Your GPS for Learning
University of the Philippines Manila
213 words · Maximum 300 words

A learner can have access to excellent lessons and still not know which earlier skill is blocking the topic in front of them. In algebra, an error while solving a quadratic might involve factoring, multiplication, or the zero-product rule. Sending everyone through the same review can miss that distinction.

BACKTRACK addresses this navigation barrier among secondary mathematics learners returning to a current classroom or self-study goal. It does not claim that prerequisite gaps explain the entire Philippine education crisis. Teaching quality, language, attendance, household conditions, and access also matter.

The proposed school work starts with teacher-confirmed destinations and recurring access to devices and Khan Academy. We will record learners excluded or delayed by connectivity rather than assuming universal access. Learners needing support beyond the route will be referred to an educator.

Local validation remains a priority before implementation. We plan permitted walkthroughs with 10–15 learners and interviews with 3–5 teachers to examine recent experiences, existing workarounds, incorrect prerequisite assumptions, acceptable teacher effort, and realistic schedules. The findings will guide the first school cycle.

The central need to validate is specific: whether learners and educators would benefit from a clearer route between current difficulty, relevant Khan practice, and successful return to today's task. Findings will determine which destinations and school routines enter the pilot.
