Dunlo: Explore, Learn and Return with Khan Academy

University of the Philippines Manila

210 words · Maximum 300 words

A learner may have access to excellent material and still face three everyday difficulties: choosing where to start, understanding a missing step and remembering what to revisit. Dunlo connects these moments so that discovering an interesting explanation can lead to continued learning.

The intended users are Filipino learners who want an approachable way to explore a topic or keep studying. They can arrive through a shared challenge, a current learning goal or an existing Khan Academy activity. Someone who is curious can begin immediately; someone preparing for a quiz can go straight to the study tools.

The design addresses each difficulty with a concrete action. A short interactive experience provides a starting point. Relevant Khan explanations and exercises offer depth. Authored support helps with a confusing prerequisite, while saved returns and later questions make it easier to continue.

Access also shapes the experience. The site supports phone layouts, keyboard controls, still views, local progress and optional video loading. Khan practice and video require connectivity, so readable original explanations remain available alongside the external resources.

During the public launch, voluntary feedback will help us understand where learners hesitate, lose their place or encounter access problems. We will use that feedback to improve the most useful paths before expanding the content library.
