

Dunlo: ready-to-paste submission copy

Project title: Dunlo: Explore, Learn and Return with Khan Academy

Subtitle: A little curiosity. A useful next step.

Institution: University of the Philippines Manila

Coach: Justin Mesias

Students: Matthew Labrador, Paul Recio, Harry Gomez

Copy only the paragraphs under each field heading. Counts use whitespace-separated words; the live portal remains authoritative. All narratives stay below 300 words.

Executive Summary

Word count: 214

Dunlo turns a moment of curiosity into a useful learning journey with Khan Academy. Learners explore short interactive ideas, follow a topic that interests them and continue into relevant lessons and practice. It is free to use and needs no Dunlo account.

Explore combines six original interactives with four focused Khan Academy segments. Learners can scale a recipe, repartition a fraction, regroup algebra tiles or connect a graph to a filling tank. They can make a prediction, change the model, watch an explanation, save the idea or share it with someone else.

Every item in the collection connects to a reviewed Khan activity. The original Khan player and source remain visible, and the learner's place is saved when they open practice. A fresh question then gives them a chance to use the idea themselves.

When a step is difficult, Dunlo's recovery engine uses short follow-up checks to select useful support. Study packs, quiz preparation, personal notes and later review keep the wider learning journey connected.

From November 2026 to March 2027, we will develop the public launch, expand reviewed content and evaluate continued Khan use, independent application, later recall and access barriers. The project can begin through direct public access and shareable challenges, with future school and community use as additional routes to growth.

Needs Assessment

Word count: 210

A learner may have access to excellent material and still face three everyday difficulties: choosing where to start, understanding a missing step and remembering what to revisit. Dunlo connects these moments so that discovering an interesting explanation can lead to continued learning.

The intended users are Filipino learners who want an approachable way to explore a topic or keep studying. They can arrive through a shared challenge, a current learning goal or an existing Khan Academy activity. Someone who is curious can begin immediately; someone preparing for a quiz can go straight to the study tools.

The design addresses each difficulty with a concrete action. A short interactive experience provides a starting point. Relevant Khan explanations and exercises offer depth. Authored support helps with a confusing prerequisite, while saved returns and later questions make it easier to continue.

Access also shapes the experience. The site supports phone layouts, keyboard controls, still views, local progress and optional video loading. Khan practice and video require connectivity, so readable original explanations remain available alongside the external resources.

During the public launch, voluntary feedback will help us understand where learners hesitate, lose their place or encounter access problems. We will use that feedback to improve the most useful paths before expanding the content library.

Business Principles & Financials

Word count: 212

Dunlo creates value by connecting an engaging first moment to useful Khan practice and a reason to return. Its reusable assets are reviewed interactive sequences, resource mappings, authored support and fresh-question routes. Learner access stays free.

The PHP 100,000 implementation budget allocates PHP 30,000 to content and subject review, PHP 18,000 to access and usability testing, PHP 12,000 to evaluation, PHP 12,000 to accessible product operations and hosting, PHP 12,000 to original interactive production, PHP 8,000 to localization review, PHP 3,000 to public launch materials and PHP 5,000 to contingency. These planning allocations will be refined against approved grant expenses and actual costs.

We will seek grant, university extension and philanthropic or CSR support for free educational delivery and maintenance. The model does not charge for Khan Academy resources or place advertising in the learning experience. Support arrangements must respect Khan Academy's content and brand conditions.

The current static deployment and device-local progress keep infrastructure manageable without an account database or hosted AI tutor. Ongoing costs include subject review, content updates, accessibility, hosting and support.

A named maintenance owner, documented recurring budget and reusable publishing process will support continuation. We will track actual expenditure and volunteer effort, then relate costs to observed participation and learning activity. Funding has not yet been secured.

Innovation

Word count: 205

Dunlo connects a playable discovery feed to a continuing learning journey. A short interactive idea can become a saved interest, a Khan activity, a useful support route and a later opportunity to apply the concept.

The feed mixes original visual experiences with authentic Khan Academy segments. Learners change quantities and watch the relationships: a recipe keeps the same proportions, a fraction keeps the same amount, and algebra pieces keep their meaning as they move. Predictions invite thought before the explanation.

The next action follows the learner's intent. They can explore freely, open relevant Khan practice or work through a difficult step. Short authored checks help choose support without treating a single answer as a diagnosis. Fresh questions and later review carry the idea beyond the first interaction.

The innovation lies in this connected experience around Khan Academy. The first collection uses reviewed content and authored rules, keeping the journey explainable and manageable. It also supports direct entry from an existing Khan activity, so discovery and deliberate study share the same tools.

The system keeps exploration separate from independent assessment and reserves exposed examples before fresh checks. We will evaluate whether connecting these experiences helps learners continue useful Khan practice and apply what they have studied.

Meaningful Khan Academy Integration

Word count: 218

Khan Academy is part of the feed and the learning path. Every item in the initial Explore collection has a reviewed Khan mapping, a visible source and a relevant exercise link.

Four items present focused segments from original Khan Academy lessons on distribution, binomial multiplication, like terms and factoring. Their reviewed start and end times include the factoring explanation at 2:22–3:56. Learners press Play, retain the original player and can continue watching or open the full lesson.

Original Dunlo interactions prepare learners for the related Khan concept. A recipe comparison leads toward rates; algebra pieces lead toward distribution and factoring. Learners can open practice and return to the same discovery, then try a fresh question or request further help.

Learners can also bring a supported Khan activity directly into Dunlo and build a study session around it. Saved packs and later review keep that learning goal available when they return.

We will measure repeated relevant Khan activity and continued participation, distinguishing resource opens, learner reports and authorized platform records where available. Dunlo does not automatically synchronize Khan scores. The broader science tools remain usable while additional Khan mappings are reviewed.

Dunlo is an independent project. Official Khan material is clearly attributed, original Dunlo activities are labelled separately, and all Khan Academy content remains freely available on Khan Academy.

Potential to Scale

Word count: 201

Dunlo can reach learners through a public, self-service experience. A shared link opens a specific interactive idea, which can lead into relevant Khan learning and a saved study path. The initial launch does not depend on classroom setup.

We will introduce the service through public demonstrations, searchable topic pages and shareable challenges. Each link gives a new learner a concrete starting point, while saved interests and later review support return visits.

Growth will use repeatable content sequences. Each needs a clear concept, an accurate interaction, a reviewed Khan mapping, a useful explanation and fresh practice. Reusing this structure makes expansion manageable while preserving content quality.

The current mathematics collection and wider mathematics and science study tools provide a base for additional subjects. Future work includes reviewed Filipino explanations, further Khan mappings and original offline mini-packs. Content review and accessibility checks will accompany each expansion.

Teachers and community groups could also reuse the links and existing activity sheets when opportunities arise. These would extend the public model rather than determine whether it can begin.

A documented review and publishing process will help additional contributors maintain the library. We will track content maintenance, support effort and recurring costs so that growth remains sustainable.

Potential Positive Impact

Word count: 202

Dunlo aims to help learners begin useful Khan Academy work, continue when a step becomes difficult and return to ideas worth remembering. Its intended outcomes are sustained relevant practice, independent application and later recall.

Implementation will run from November 2026 to March 2027. We will prepare the public launch and reviewed content, gather voluntary usability and access feedback, refine the experience, evaluate continued use and publish findings with a continuation plan.

The evaluation will distinguish discovery interactions, Khan resource opens, learner-reported activity, authorized platform records where available, independent answers and later recall. This allows us to see whether an engaging entrance leads to useful learning activity beyond the feed.

A voluntary learning evaluation will use unfamiliar immediate questions and later follow-ups, with suitable consent and any required school or parent or guardian permissions. It will report non-completion and access barriers as well as successful outcomes. Where feasible, a comparison with direct Khan use can help assess the contribution of Dunlo's connected journey.

Browser-local progress keeps the learner's journey connected. The implementation will establish a separate voluntary evaluation process.

By March 2027, we aim to deliver a usable public learning pathway, a reviewed content library and evidence that guides future improvements and expansion.

Executive Summary: character-limit fallback

The public form definition checked on September 13, 2026 still sets max_length 300 despite a 300-word label. Respect the live validation. Use the full summary if the portal permits it. Otherwise this concise fallback is 253 characters and 36 words:

Dunlo is a free independent learning project. Explore playable ideas and focused Khan Academy clips, continue into relevant practice, and return for fresh questions. Saved discoveries, useful support and later review keep the learning journey connected.

Your completed team fields

The owner confirmed the institution, adviser and student fields are already filled in. Keep those completed fields. Replace the project narratives and upload the final PDF after your final review. The confirmed deadline is September 18, 2026 at 11:59 PM Philippine time. This package does not submit the application.
